Fighting for my Mom - Had First Treatment - Darzalex original unsuccessful, Darzalex Faspro up next

My mom had her first Darzalex treatment last Thursday and it didn't go well. She had nausea and vomiting, and shortness of breath and they recommended her go to the ER to get evaluated. Thankfully, the Benadryl they gave her really worked in, but I think they just wanted to make sure she was OK and that her symptoms resulted from the Benadryl. Because she has a neuropathy illness in addition to multiple myeloma, her nervous system is extremely sensitive, so while they were running the Darzalex infusion she began to have trimmers that looked like seizures, but they're not. So they had to run it very slowly, and even still, she was having them. She didn't even

Oncology patients report complex drug-side effects interactions months (or years!) before official recognition – *how can we detect these signals earlier?*

Clinical Trial (Erlotinib) for early stage adenocarcinoma

kcirioli

Oct 9, 2019 • 10:31 AM

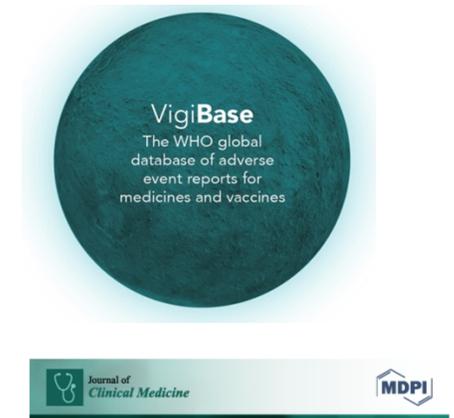

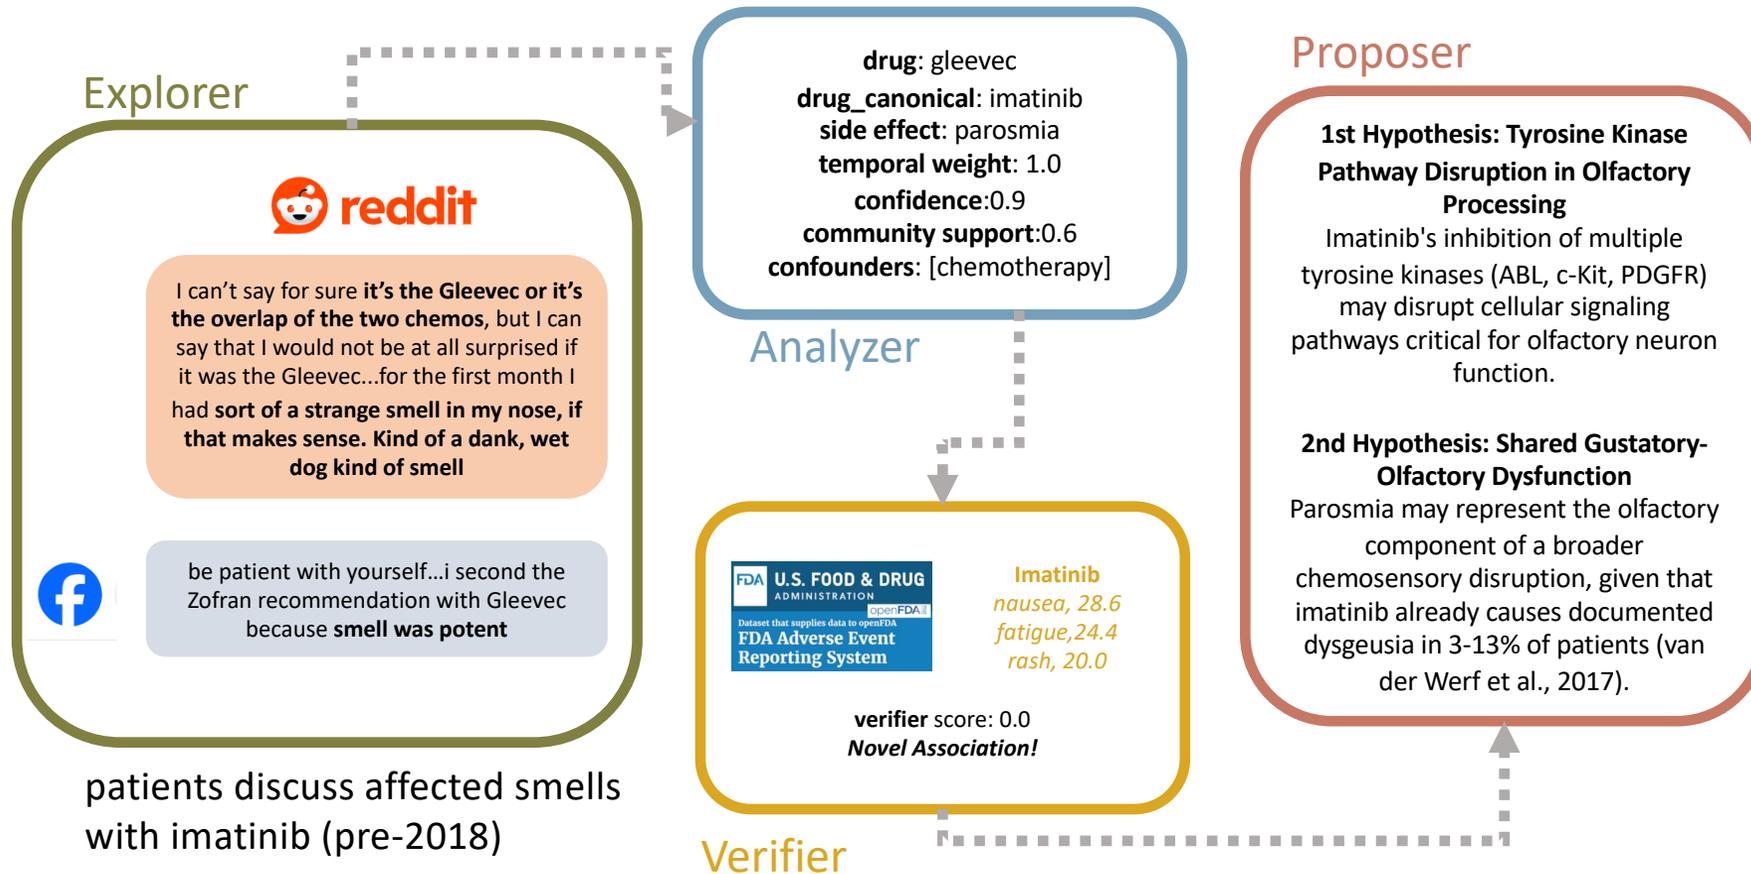

Are there any people on here who are in, or are considering a clinical trial Erlotinib who fit the following criteria?

People who have NSCLC, early stage, adenocarcinoma, EGFR mutation, had surgery and completely removed a lobe plus tumor followed by adjacent chemotherapy. This study will last up to 2 years if side effects can be tolerated. Some of the side effects seem quite severe. I am in the

- Research team new what drug-symptom associations to search for (e.g. hypohidrosis)
- Focused only on skin-related side effects
- Required manual labeling to train DeepHealthMiner to detect posts related to side-effects

Overview of Echo

J Clin Med. 2022 Aug 9;11(16):4641. doi: [10.3390/jcm11164641](https://doi.org/10.3390/jcm11164641)

Drug-Associated Parosmia: New Perspectives from the WHO Safety Database

31m/Melanoma Stage 4m1c

Most of the people I know are taking dabrafenib (Tafinlar) and trametinib (Mekinist). Not just trametinib and they have similar side effects as zelboraf which is joint pain, sun sensitivity and fatigue. I think most of those are from the dabrafenib not the trametinib. I am surprised that they didn't combine it with a braf inhibitor. Do you have the braf mutation? I was supposed to switch from zelboraf to the dabrafenib (Tafinlar) and trametinib (Mekinist) combo, but the drs decided to wait. Good luck with your journey.

Photoproduct Formation Hypothesis:
Dabrafenib may form UVA-absorbing photoproducts when exposed to ultraviolet radiation, similar to the mechanism established for vemurafenib [Eberlein et. al., 2020].

Test this by exposing dabrafenib to UVA radiation in vitro and measuring spectrofluorometric changes, then applying the drug and irradiated metabolites to cultured keratinocytes to assess cytotoxicity differences.

Result 1: Comparing Explorer Agents

Agent for Explorer	Keyword Baseline	Claude 3.5 Haiku	Claude 3.5 Sonnet
Total Drugs	40	141	131
Total (Drug, ADR) Associations	378	288	640
Recall (Restricted Set)	0.22	0.08	0.27

- Smaller LMs underperform simple baseline in symptom extraction
- General low recall → patient bias to discuss rare symptoms on forums

Result 2: Novel Associations

Association	Temporal	Confidence	Community	Verifier	Patient Quote
Pembrolizumab → Daytime somnolence	10/10	10/10	10/10	0.0	asleep at my desk mid-afternoon
Paclitaxel → Laryngeal edema	10/10	10/10	10/10	0.0	my throat was closing up
Nivolumab → Pericardial effusion	10/10	10/10	8/10	0.0	two emergency pericardial windows
Fluorouracil → Abdominal bloating	8/10	8/10	10/10	0.0	she feels bloated especially after food
Oxaliplatin → Social withdrawal	8/10	8/10	8/10	0.0	I've withdrawn from all social interactions

Result 2: Novel Associations

Association	Proposer Report
Pembrolizumab → Daytime somnolence	Primary Hypothesis: Immune-Mediated Sleep-Wake Cycle Disruption. Pembrolizumab's PD-1 checkpoint inhibition may trigger excessive immune activation that disrupts hypothalamic sleep-wake regulatory circuits[Krueger et al., 2016, Imeri and Opp, 2009]...
Paclitaxel → Laryngeal edema	Primary Hypothesis: Hypersensitivity-Mediated Laryngeal Inflammation. Paclitaxel is formulated with Cremophor EL (polyoxyethylated castor oil), a known histamine liberator that can cause immediate hypersensitivity reactions in 2–4% of patients [Weiss et al., 1990]...
Nivolumab → Pericardial effusion	Primary Hypothesis: Immune-Related Adverse Event (irAE) via T-cell Hyperactivation. Nivolumab's blockade of the PD-1/PD-L1 checkpoint pathway removes critical immune tolerance mechanisms, potentially triggering autoimmune-mediated pericarditis...
Fluorouracil → Abdominal bloating	Primary Hypothesis: Gastrointestinal Microbiome Disruption and Dysbiosis. Fluorouracil's cytotoxic mechanism through thymidylate synthase inhibition may significantly alter the intestinal microbiome composition. This microbial imbalance could result in increased intestinal gas production and impaired gas clearance, manifesting as abdominal bloating...
Oxaliplatin → Social withdrawal	Primary Hypothesis: Platinum-Induced Neuroinflammation and Limbic System Dysfunction. Oxaliplatin's platinum compounds may accumulate in brain regions critical for social cognition, particularly the prefrontal cortex and limbic system.

Result 3: Confounding Variables

Confounding variable	Example (Drug, ADR)
surgical menopause	(letrozole, weight loss), (zoledronicacid, cognitive impairment), (tamoxifen, depression)
multiple myeloma	(daratumumab, nausea and vomiting), (dexamethasone, renal failure), (lenalidomide, general malaise)
recent surgery	(bevacizumab, impaired wound healing), (pegfilgrastim, sepsis), (pembrolizumab, pain)
male	(cabozantinib, hypertension), (oxaliplatin, social withdrawal), (ciltacabtageneautoleucel, CD4 lymphopenia)
young age	(bleomycin, alopecia), (etoposide, fatigue), (epcoritamab, serious infections)

4 case studies showing “early warning”

pre-2017

- *“I developed pneumonitis and had to be hospitalized for 5 days, which is also why i haven’t resumed treatment ” (nivolumab, r/cancer)*
- *“My aunt finished chemo and keytruda but developed severe pneumonitis adverse event from keytruda...” (pembrolizumab, r/cancer)*
- *“I had a 3 week fever, it was pretty awful. But got through it...” (nivolumab, r/cancer)*

2018

In this issue of the *Journal of Thoracic Oncology*, Suresh et al.⁶ address the incidence and risk factors associated with CIP in a retrospective cohort of 205 advanced NSCLC patients treated over a 10-year period in an academic center. Notably, all cases of CIP were determined by multidisciplinary team consensus as to exclude patients with disease progression or infection. No consistent radiological pattern of CIP was identified in this series. Within this cohort, consisting of both trial and nontrial patients, CIP incidence was 19% (n = 39), much higher than previously reported in clinical trials. Most cases of CIP occurred within 6 months of treatment initiation, with greater than 50% of cases graded as severe (grade 3-5). Squamous histology was significantly associated with higher rates of CIP (incidence rate ratio: 2.29, 95% CI: 1.08–4.83) whereas female sex and use of combination checkpoint inhibitors showed a nonsignificant trend towards higher CIP incidence. All patients received first-line

Supporting Evidence

Quote 1:
Hopefully this is a chemo rash or some sort of Keytruda side effect

Quote 2:
After the second treatment I experienced a rash and intense itching

Takeaways

1. Today's language models can better understand subtleties in patient experiences
2. Social media can be more timely than trial data / EHRs!
3. Future work: expand to more patient discussion forums and non-oncology drugs
 - *What happens when Reddit/other forums get filled with AI-generated content?*
